

RESIN MIXER RM1000

The model RM-1000 mixing machine is designed from the ground up to mix messy resins with no cleanup.

The mixer grips your container and rotates it while a stationary mixing paddle creates turbulent mixing. The speed of mixing can be precisely controlled for bubble-free mixing. After mixing is done, just throw away the disposable cup and paddle, which means NO CLEANUP!

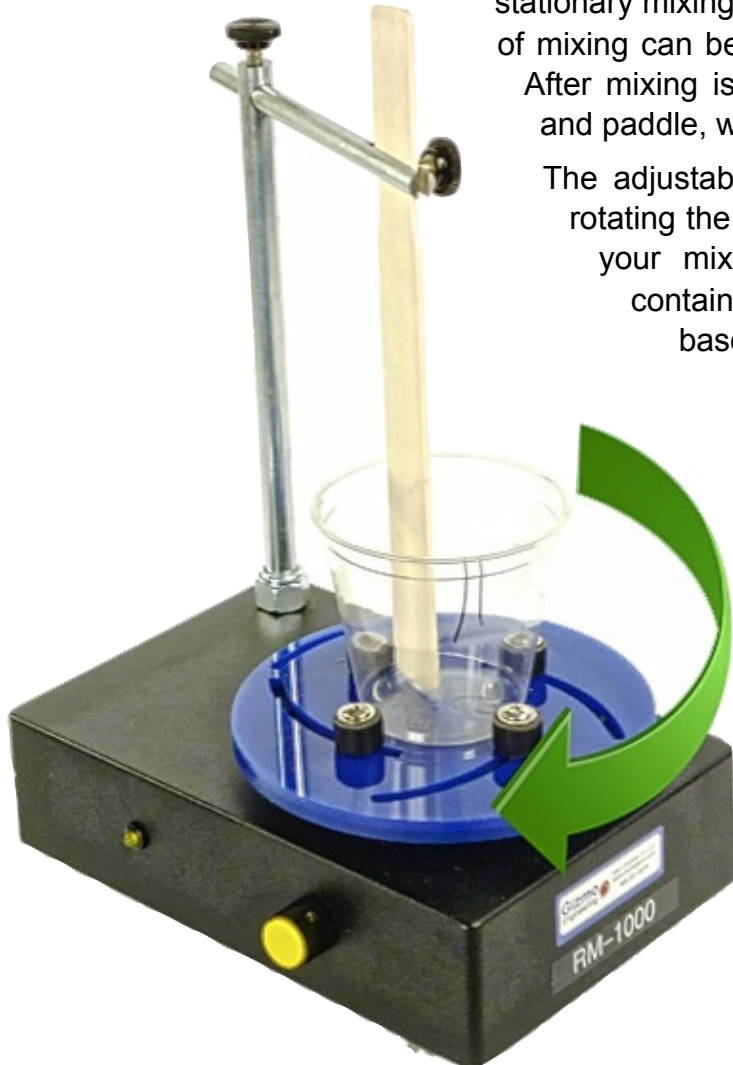

The adjustable chuck grabs your cup quickly by simply rotating the top disc clockwise to tighten the grippers on your mixing container. It accommodates mixing containers up to 106mm [4.2 inches] across the base. (approximately 1000 ml)

Once the cup is set in the chuck, insert a disposable paint paddle in the "stick holder". The stick-holder adjusts position of the paddle to exactly fit any container diameter and wall slope.. After that, turn on the motor to desired speed.

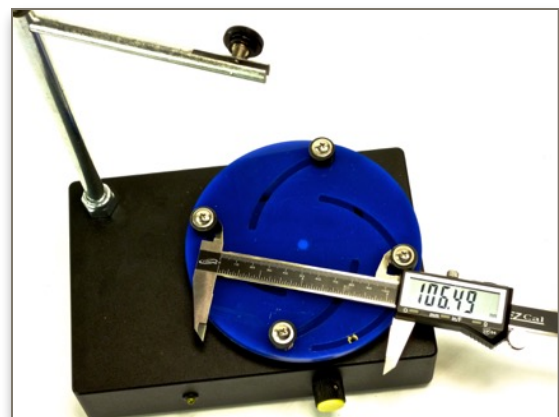

The no-cleanup design is a must for labs or small production operations when mixing frequently. Useful for epoxy resins, polyester resins, paints, adhesives - any messy liquid.
