

DRUMALARM WITH MANIFOLD

The Drumalarm with manifold will feed a number of different pumps from the same drum.

The unit in the picture has two float switches above each other inside the pipe; one is an early warning when the drum is almost empty, and then an inch below that, is the “completely empty” float level switch. Each low level switch gives a different sound and LED flashing pattern so it can be identified at a distance.

This particular unit in the picture is equipped with a check valve at the bottom of the suction pipe so priming shouldn't be necessary. Nevertheless, there is a threaded plug at the top for conveniently priming pumps if necessary.

This drum alarm has all the usual features of our drumalarms like adjustable cap, silencing button, low battery detection alarm.

We are working on a option to have the LED flash different colors for each level and a third different color for the low battery alert.

DOUBLE FLOAT SWITCH
